

INVENTION DISCLOSURE FORM

1. Title of the Invention:

JukeBobs: A Session-Based Crowd-Interactive Entertainment Platform with Smart Music Queuing, Monetization, Gamified Party Engagement, and AI-Driven DJ Automation

2. Inventor(s) Details: Please note that each person who made a contribution to the invention must be named as an inventor in this section.

Primary Inventor:

Bobin Abraham Jacob

Contribution:

Concept ideation, system architecture, workflow design, feature definition, monetization logic, AI DJ concept, game mechanics, transparency and fairness mechanisms, and overall product vision.

3. What is the problem solved by your invention?

At social gatherings such as house parties, DJ events, clubs, and private celebrations, music and entertainment control is typically centralized and inefficient. Common problems include:

- Unstructured and chaotic song requests
- Repeated interruptions to DJs or hosts
- No fair prioritization of requests
- Lack of transparency on what has been played or will be played
- No integrated system for audience engagement, voting, or tipping

- Limited monetization options for DJs, artists, or hosts
- Absence of a unified platform combining music, games, and event discovery

Existing solutions such as playlists, streaming apps, or DJ request tools do not provide **real-time crowd control, fairness enforcement, monetized prioritization, refund transparency, and AI-assisted DJ functionality** within a single platform.

4. Explain how your proposed invention solves the problem. Include details of technical aspects of your invention. Also, provide physical dimensions of components, materials involved, shapes, etc., if applicable.

The invention introduces JukeBobs, a software-based, session-driven party platform that enables real-time crowd participation, transparent music control, gamified engagement, and AI-powered DJ automation using mobile devices.

Technical Overview

The platform operates using temporary digital sessions created by a host (DJ / party owner). Each session generates a QR code or room code, allowing guests to join instantly using smartphones.

Core Technical Components:

1. Session Management Engine

- Create, join, and resume sessions securely
- Host authentication via password and secret verification
- Guest authentication via name + room code

2. Crowd-Controlled Jukebox System

- Dual queue logic:
 - VIP Queue (paid / tipped priority)
 - General Queue
- Duplicate song request prevention

- Automatic movement of played songs to a “Recently Played” list
- Time-bound VIP lock to prevent monopolization
- Voting-based song selection from general queue

3. Monetization & Transparency Layer

- Integrated wallet and payment gateway
- Tips accumulated at host wallet with platform commission
- Automatic refund of tips if a requested song is not played
- Full visibility of played songs and transaction outcomes

4. Audience Engagement Mechanisms

- Live voting windows
- “Clap / Appreciation” reactions during playback
- Leaderboards for most appreciated songs
- Session history with limited data retention

5. Arcade / Game Zone Module

- Multiplayer party games within the same session
- Virtual token (“marble”) economy with fair-play rules
- Leaderboards and champion determination logic

6. AI DJ Module – DJ ARTIN

- AI-powered virtual DJ using uploaded local audio files
- Smart beat matching, tempo alignment, and smooth transitions
- Designed for hosts who cannot afford professional DJs

7. Event Discovery Module (WTPT – Where’s The Party Tonight?)

- Event listings, artist promotions, gig updates
- Ticket booking redirection to third-party platforms
- Party discovery without acting as a broker or intermediary

The invention is purely **software-based and cloud-hosted**; no fixed physical dimensions or hardware components are required.

5. Provide technical drawings or any renditions you may have of your proposed invention below. You may also provide a rough sketch of working parts/components of your invention in the space below:

**** This will be provided shortly ****

6. What are the benefits offered by your proposed invention?

- Fair and transparent song request handling
- Increased audience engagement and participation
- New monetization opportunities for DJs and hosts
- Refund-based credibility system for paid requests
- Gamified party experience beyond music
- AI-powered DJ functionality for low-budget or casual events
- No physical hardware dependency
- Scalable across house parties, clubs, weddings, and festivals

7. Are you aware of any similar ideas that at least partially map onto your proposed invention? How is your proposed invention different than any other similar ideas in general?

While music streaming platforms, digital jukeboxes, and DJ request apps exist, they differ significantly from JukeBobs.

Key Differentiators:

- Session-based crowd control instead of static playlists
- Dual queue system with time-bound VIP logic
- Refundable tipping based on actual song playback

- Real-time voting and audience-driven prioritization
- Integrated party gaming and leaderboard mechanics
- AI DJ automation using locally uploaded tracks
- Unified platform combining music, games, and event discovery

JukeBobs uniquely integrates crowd control, artist monetization, AI assistance, and gamified interaction in one system.

8. Has the invention been published or disclosed to any other entity including scientific papers, conference abstract, theses, customer sampling, or a product relating to the invention been publicly introduced, quoted, sampled or shipped? Was there a nondisclosure agreement (NDA) with the other entity, if the invention is disclosed to the other entity?

The invention has not been publicly published or commercialized.

- Preliminary discussions have occurred with legal advisors and potential collaborators
- Such discussions were conducted or intended to be conducted under Non-Disclosure Agreements (NDAs)
- No public demonstrations, customer sampling, or product launches have taken place

9. What is the current state of development of your proposed invention (e.g. concept, prototype, full scale)?

The invention is at an advanced working prototype stage.

- Functional prototype for:
 - Crowd-controlled jukebox sessions
 - Karaoke-style request handling
 - Arcade/game zone sessions
- Completed UI/UX for artist, host, and guest roles
- Backend and frontend code developed under “JukeBobs”

- Platform branding and logo (JB) completed
- Live prototype validated for artist-hosted sessions

Ongoing Development:

- DJ ARTIN, an AI-powered performance automation system
- Expansion of AI features for live performers and event hosts

10. Who would most likely benefit from the proposed invention? You may provide names of companies or any such entities etc. that may be interested in your proposed invention.

Primary Beneficiaries:

- DJs
- Karaoke Jockeys (KJs)
- Live musicians and bands
- Independent artists and performers
- Party hosts and event organizers

Potential Interested Entities:

- Nightclubs, lounges, pubs
- Karaoke venues
- Event production companies
- Artist monetization platforms
- Music and entertainment technology companies

One-Line IP Positioning

JukeBobs is a **session-based interactive entertainment platform** enabling DJs, karaoke jockeys, live musicians, and artists to engage audiences through crowd-controlled performances, monetized and refundable prioritization, gamified participation, and AI-powered performance automation.
